**Amendments to the Specification**

Please amend paragraph [0003] as shown below:

[0003] Conventional carpet and upholstery cleaning compositions typically contain anionic and/or nonionic surfactants, an anti-soiling agent such as polymerized styrene/maleic anhydride, a solvent such as glycol ether, and a fragrance to impart a pleasant scent. Known carpet cleaning compositions are disclosed in the Campagna et al. U.S. Pat. No. 5,955,413 and Scialla et al. U.S. Pat. No. 5,928,384, both of which are incorporated herein by reference. Examples of commercially available cleaning solutions include: BISSELL Fiber Cleansing Formula, Hoover Steam Vac carpet/upholstery detergent, Dirt Devil carpet & rug shampoo, Rug Doctor Steam Cleaner, and Full Release Professional Carpet Cleaner by Oreck. The BISSELL Fiber Cleansing Formula comprises water; an anti-stain agent; an acrylate copolymer that functions as an anti-soil agent and a pH adjusting agent; an alkyl naphthalene sodium sulfonate, which is an anionic surfactant; a blend of two alkoxyated lineal alcohols, which is a nonionic surfactant; a trace of an ~~anti-form~~ anti-foam agent; and a fragrance.

Please amend paragraph [0022] as shown below:

[0022] The surfactant in the cleaning composition stabilizes the terpene hydrocarbon in solution and creates minimum residue that can be vacuumed and removed after the cleaning process. The surfactant can be one or a combination of surfactants, including nonionic and anionic surfactants. Suitable nonionic surfactants include blends of two alkoxyated lineal alcohols, such as Poly Tergent Blend 3-1, which is manufactured by BASF Corporation, a secondary alcohol ethoxylate, such as Tergitol 15-s-40, manufactured by Dow Chemical Company, a primary linear alcohol ethoxylate, such as Tomadol 1-5, or a linear alcohol alkoxyate, such as Nonidet SF-5. Tomadol 1-5 and Nonidet SF-5 are both available from Tomah Products. Tomadol 1-5 is made from C-11 alcohol and ethylene oxide and is especially effective at stabilizing d-limonene in solution. The nonionic surfactants can be present in the range of about 1.0 to 3.0 wt. %. A suitable anionic surfactant is an alkyl naphthalene sodium sulfonate, such as Petro ULF, manufactured by AKZO

Nobel. Further, Colamulse SBC, manufactured by Colonial Chemical Company, is an acceptable emulsifier for citrus oils.[.] The anionic surfactant can be present in suitable amounts, for example between about 1.0 and 3.0 wt. %.
